I want to know, is there a way to encrypt the database that is inside the phone memory, so that someone cannot read it, even if he gets hold of the mobile phone. How to do that. Any help? A: You cannot do that. You could encrypt the private key(s) that are used to store the actual database in your app but there is no way to keep them out of memory. So the only way someone could get access to your data would be if they had access to your phone. If someone had access to your phone they would be able to do anything they wanted with it.
